

Task A: Real Website Analysis

Analyzed Website: cvety.kz (a real flower delivery website in Kazakhstan).

Source Code Details:

- **Doctype:** `<!DOCTYPE html>`
- **Language:** `<html lang="ru">`
- **Meta tags:** `<meta charset="UTF-8">`, `<meta name="viewport" content="width=device-width, initial-scale=1.0">`
- **Semantics vs <div>:** The website uses basic semantic tags like `<header>` and `<footer>` at the top and bottom. However, they use `<div>` tags almost everywhere else (for product cards, grids, and text containers) because it makes it easier for them to apply CSS styles.

3 Structural Errors on the Real Site and How We Avoided Them:

1. **Error:** Using `<div class="nav">` or a simple list of links for the main menu.
 - **Our solution:** In our code, we used the correct semantic `<nav>` tag so screen readers and search engines clearly understand where the navigation is.
 2. **Error:** Using plain text or `<div>` next to input fields instead of proper labels.
 - **Our solution:** In our order.html file, we strictly used `<label>` tags and connected them to every `<input>` using the `for="..."` and `id` attributes to ensure perfect accessibility.
 3. **Error:** Using bold text (`<b>`) or `<div class="title">` to separate different parts of a form.
 - **Our solution:** We used the semantic `<fieldset>` and `<legend>` tags in our form to logically group "Contact Data" and "Order Details".
1. **<fieldset> (order.html):** We chose this tag instead of a `<div class="form-group">` to logically group related inputs (like personal details) inside our form.
